

# Low-code: The unifying fabric of the digital enterprise

Leading organizations are already looking ahead to a connected future where low-code platforms—powered by the adoption and convergence of emerging technologies, will unify front-, middle- and back-office functions.

## Front office

Low-code will enable harmonious multichannel user experiences across applications, and faster time-to-market for new product and service offerings

## Back office

Low-code will modernize legacy systems, automate mundane, disconnected and manual tasks, and reduce the dependency on traditional, costly and lengthy custom development projects.

## Middle office

Low-code will improve the integration and automation of processes that span the enterprise, add a unifying orchestration layer across the organization's many different applications, and bring a digital user experience to legacy systems.
