

# Stress Testing Bank Operations under

**COVID-19 Scenario**

July 2020

# Introduction

- The outbreak of COVID-19 and the impact on the wider economy has placed unprecedented pressure on businesses. The pandemic continues to put severe strain on people and businesses across the globe.
- The banking industry in particular is being hit hard by daily pivoting market conditions and deteriorating credit among others.
- The speed and size of the economic impact that COVID-19 has on bank's bottom line has brought into stark reality the importance of robust stressing testing, beyond what many banks were undertaking in the past.
- These are unprecedented times for CEOs, CROs, risk functions and business. **"Stress Testing Banking Operations under COVID-19 Scenario"** seeks to discuss the need to stress test banking operations to identify risk and opportunities, and ultimately to understand the capacity of the bank to be compliant and generate value in the era of COVID-19.
- KPMG shares its 4-step approach to stress testing and offers advice based on deep expertise and experience in Financial Risk Management within the banking sector.
- The learnings from the webinar will help banks re-align their products and investment strategies to the changes in the local and global market dynamics.

# Impact on Ghana's Economy

## Revenue Shortfall

GHC15.7  
Billion

Projected shortfalls:

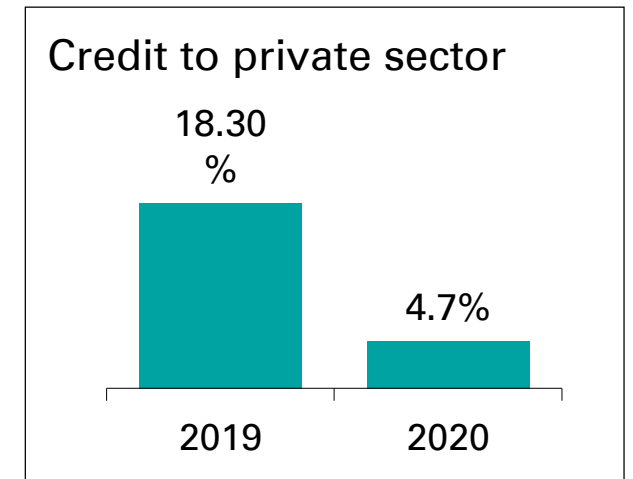

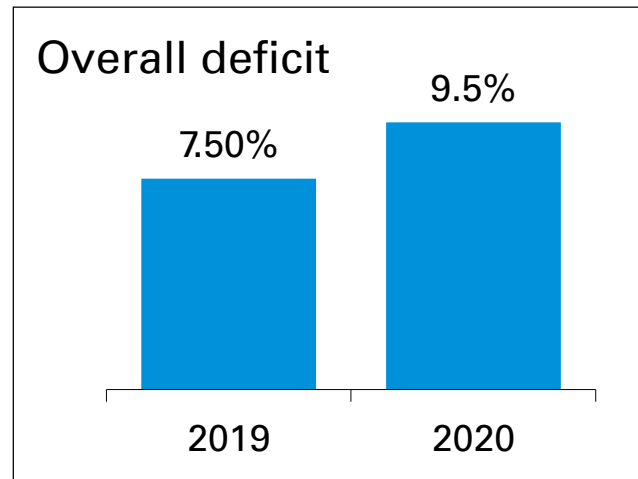

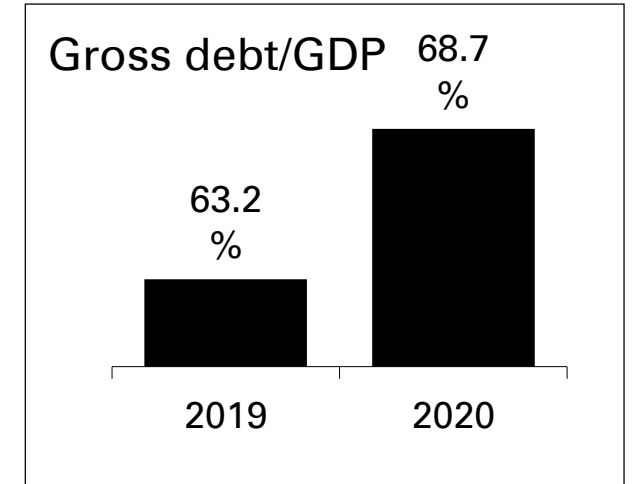

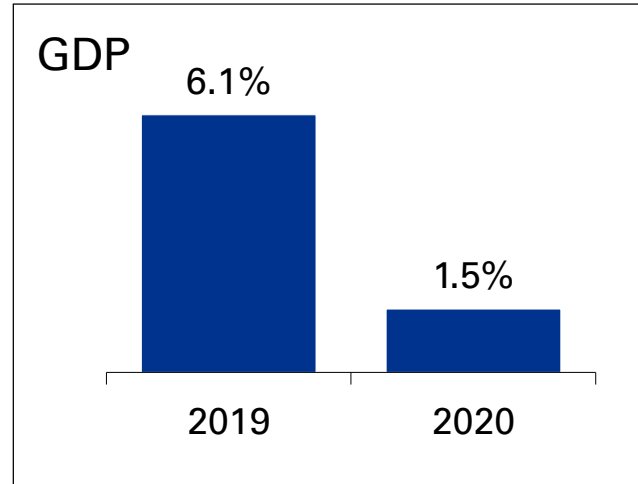

- Petroleum to fall by GHC5.7 billion
- Non-oil tax & non-tax revenue loss is projected to be GHC10 billion

## Expenditure

GHC2.8  
Billion

- Cost of a COVID-19 preparedness plan is estimated to be GHC 572 million
- Coronavirus Alleviation Programme (CAP) - 1.25 billion
- Utilities – GHC1.0 billion
- Secured syndicated facility of GHC3.0 billion from banks to support key industries

## Key macro indicators

Source: MoF and IMF Press Release 13 April 2020

# Supervisory and Other Measures

## Supervisory and related measures in Ghana

### Bank-Specific Supervisory Measures

Reduction in the Primary Reserve Requirement from 10% to 8%

Reduction in the Capital Conservation Buffer from 3.0% to 1.5%, hence reducing Capital Adequacy Ratio (including CCB) from 13% to 11.5%

Reduction in provisions for loans in the "Other Loans Especially Mentioned" (OLEM) category from 10% to 5% for all banks and Special Deposit Institutions (SDIs)

Suspension of dividend payments and distributions to shareholders, to ensure banks have liquidity to support their operations

### Other Supervisory Measures by BoG and Related Institutions

Cut of key interest rate to 8-year low by 150 basis points (bps) from 16% to 14.5%

BOG Asset Purchase Programme up to GH¢10 billion. BOG has purchased a GH¢5.5 billion Ghana COVID-19 Relief Bond with 10 year tenor and 2 year moratorium on principal and coupon pegged at MPR

Ghana Interbank Payment and Settlement Systems Limited (GhIPSS) removed charges, on all electronic payments services used by its partner financial service providers

Banks, through the Ghana Association of Bankers, have collectively agreed to reduce interest rates on lending by 2%

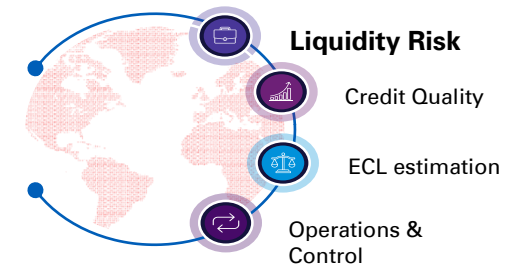

# Impacts on Bank's Risk Management - Liquidity Risk

“  
Liquidity is cushioned by Bank of Ghana policy announcement relating to capital reserve reduction  
”

“  
Treasury needs to work more closely with business to understand asset repayment and disbursement requirements better in a fast changing environment  
”

“  
Short term to medium term liquidity risk will need to be stress-tested  
”

“  
Repayment events due to moratorium period need to be remodeled  
  
Impact of heightened delinquencies likely to surface by Q2 and Q3 post the moratorium period to be worked out  
”

# Impacts on Bank's Risk Management - Credit Quality

“  
Aviation, travel and hospitality,  
auto and auto ancillaries, real  
estate and construction to generate  
stressed assets  
Banks profitability will come under  
pressure  
”

“  
Infrastructure sector to come  
under immense pressure  
Sharp decline in demand will  
further compound the effect  
”

“  
SMEs involved in discretionary  
goods and services are likely to be  
adversely impacted  
The segment needs liquidity and  
credit support  
”

“  
Borrowers would require their  
credit facilities to be restructured  
based on revised business cash  
flows thus necessitating one time  
restructuring of loans  
”

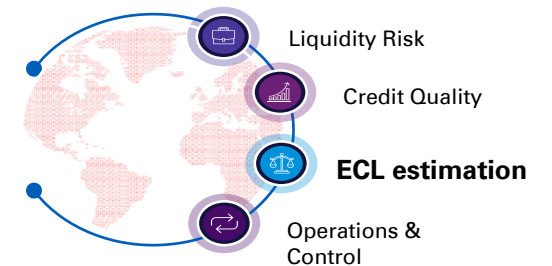

# Impacts on Bank's Risk Management - ECL Estimation

“ Due to moratorium provided to the borrowers and deferment of NPL classification norms, default definition and significant increase in credit risk (SICR) will remain the same ”

“ Probability of Default (PD) estimates for various portfolios going to increase when forward looking macro economic parameter adjustments are applied  
Loss Given Default (LGD) is also expected to increase due to lower recoverability of assets ”

“ Exposures At Default (EADs) expected to increase due to higher drawdowns of credit facilities and moratorium / payment feature enablement in loans  
Due to lack of data availability, management estimates will pay a larger role ”

“ Expected Credit Loss (ECL) as a whole is going to increase due to higher weight applied to severe downturn scenario while conducting scenario analysis  
Management will have the responsibility of higher disclosure in their quarterly reports ”

# Impacts on Bank's Risk Management - Operations & Control

“

Proportion of banking services availed through digital channels particularly payments to increase

”

“

Banks have now to adopt innovative approaches to digitization of processes, optimization of its workforce and a more active BCP sites

”

“

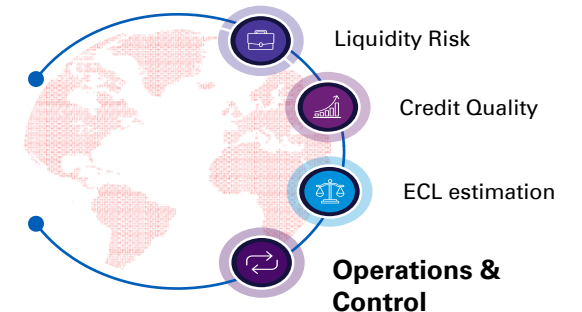

Banks required to revisit their internal rating models based on revised macro economic and idiosyncratic risks

”

“

Social engineering scams are on the rise using social media and telecommunication channels due to work-from-home enablement

”

# Summary of key observations

Economic decline as projected GDP is expected to fall from 6.8% to 1.5%

1

2

Public debt rising and will put pressure on government's debt sustainability

Stock market experiencing falls with drops in price-to-book value of listed companies

3

4

Second quarter performance of banks showing revenue decline but expected to pick up

Continued pressure on bank's to deploy assets efficiently for recovery

5

6

NPLs likely to rise due to impact on key sectors like tourism, exports, manufacturing etc.

# How can stress testing help Banks?

*How stress testing can help*

**Explore portfolio vulnerabilities by assessing borrower interdependence**

**Enables stabilization of the asset quality and prevent further deterioration in credit**

**Realign the product and investment strategy to changes in the local and global market dynamics**

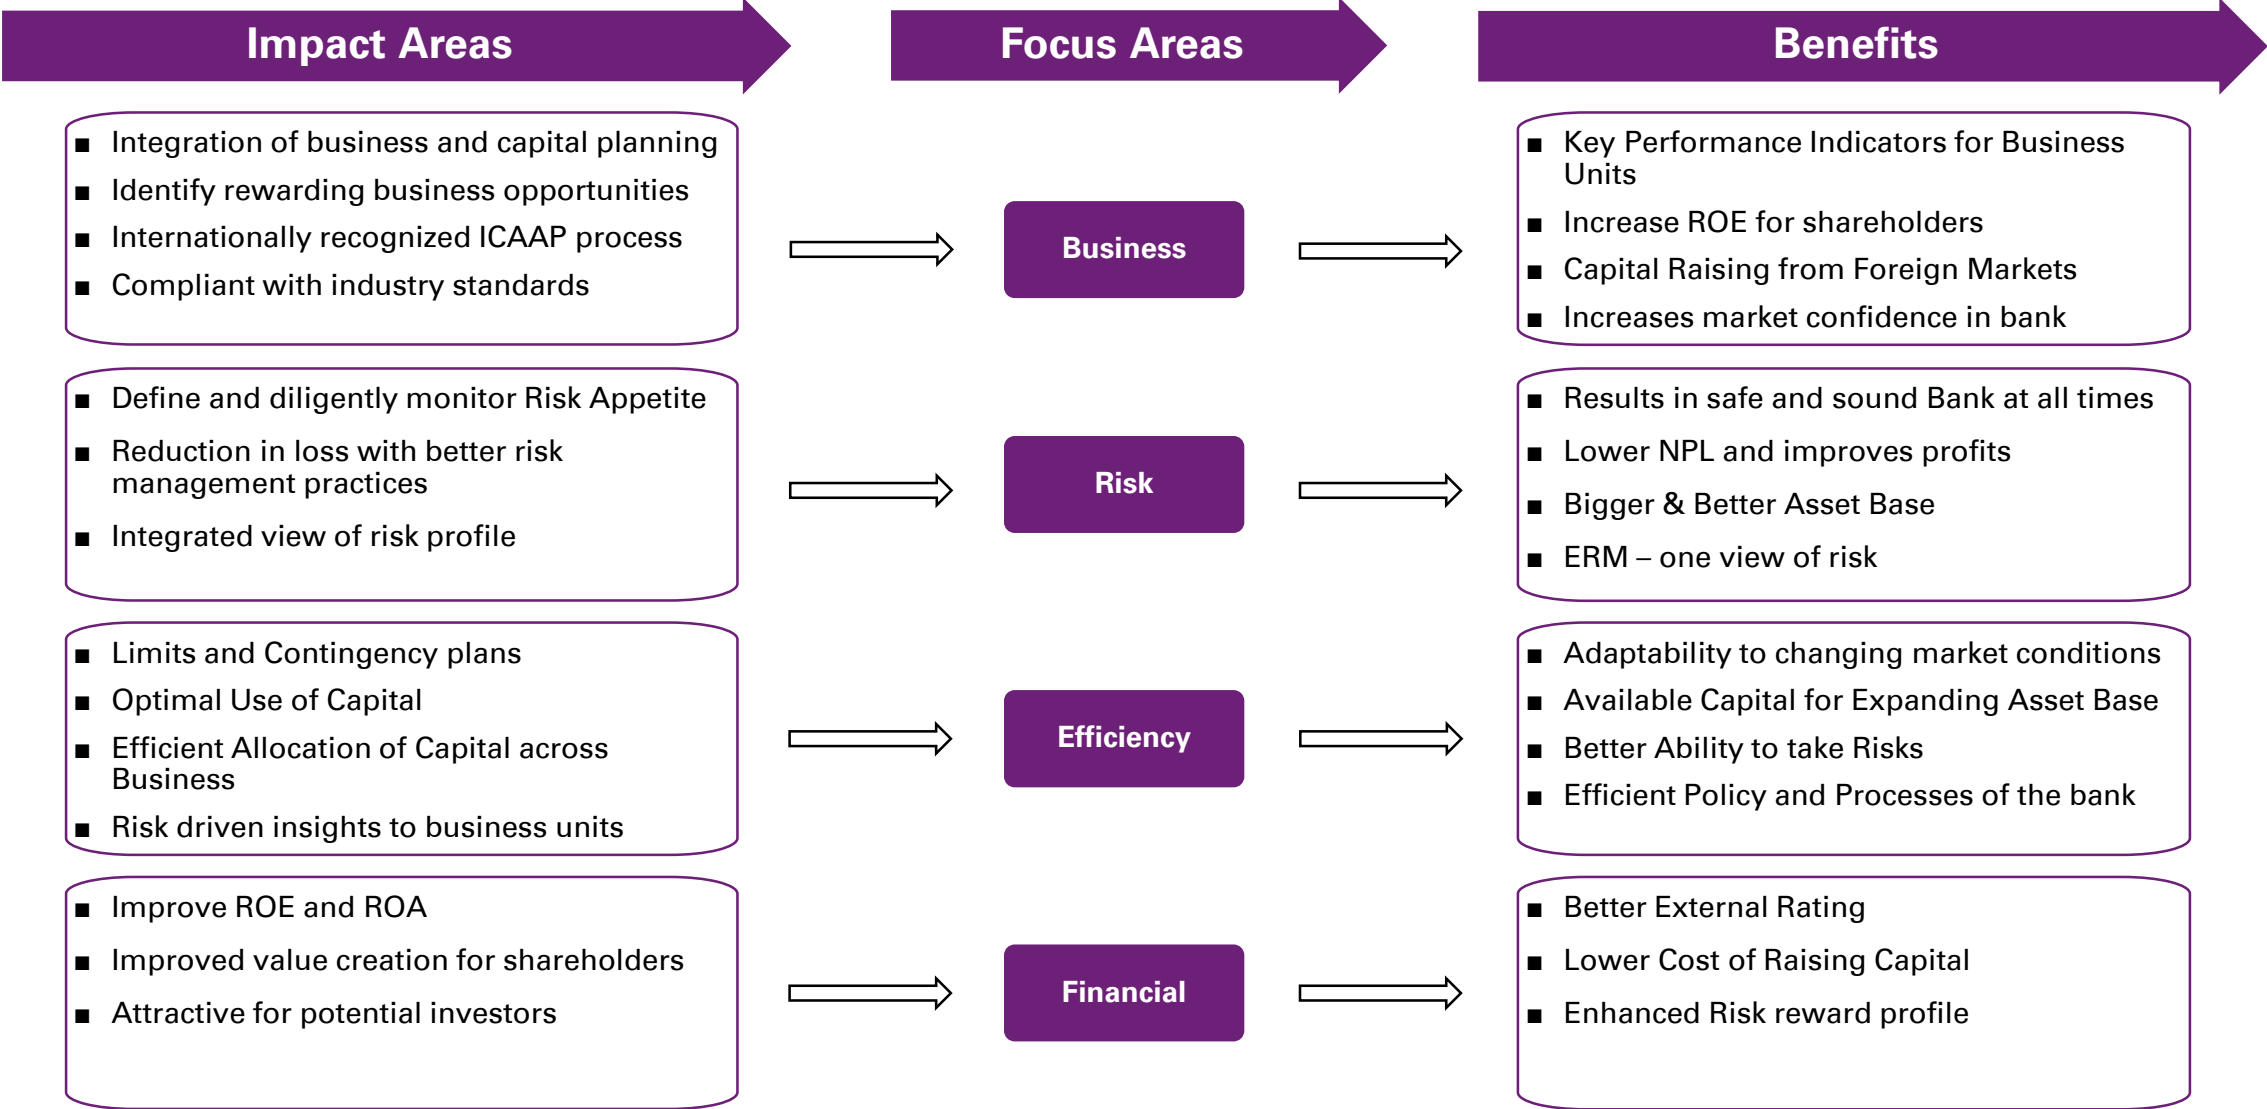

**Enables development of contingency plans to ensure funding stability**

**Manage volatility in the earnings and profitability, and manage shareholder expectations**

**Prevents liquidity drain and any contagion effect**

**Build up Financial Resilience**

# Stress Testing as a Business Driver...

# KPMG's 4-Step Approach to Stress Testing

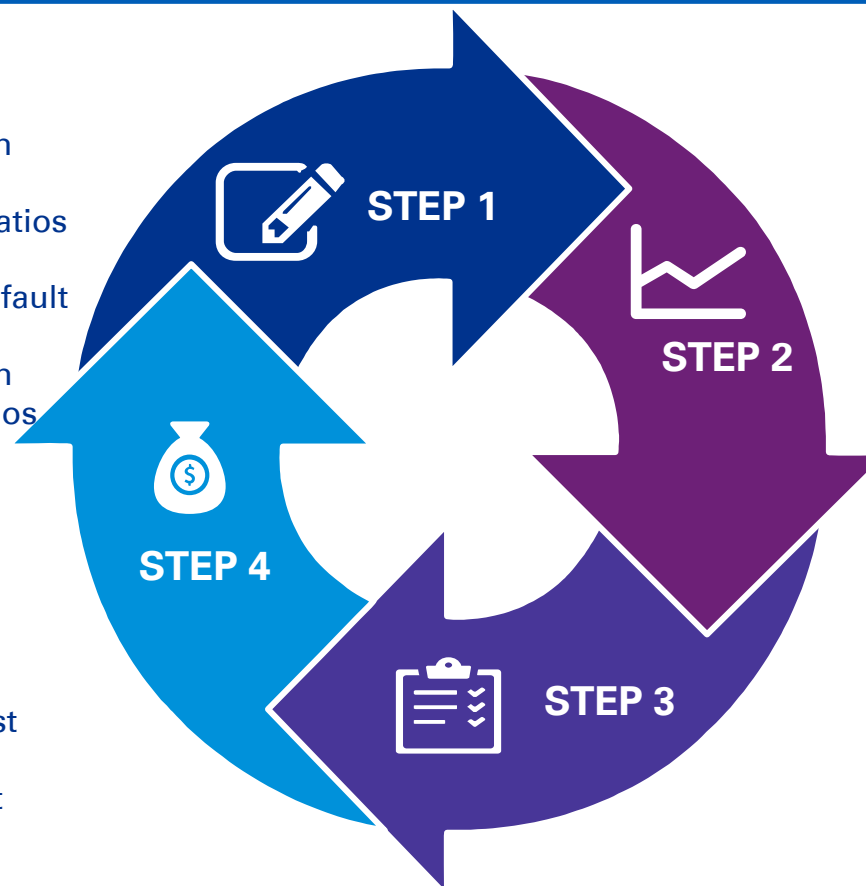

*KPMG recommends to Banks to run "targeted stress tests" to identify vulnerable credit, sector and supply chains and take proactive action*

## STRESS LOAN PORTFOLIOS

- Design scenarios (i.e. travel bans, supply chain shocks, retail shocks)
- Stress underlying cashflow and debt service ratios for all obligors
- Transmit impact to loan level probability of default (PD)
- Calculate expected loss and RWA for each loan
- Re-run simulation based on a range of scenarios and aggregate results

## TAKE PREVENTIVE ACTIONS

- Proactively target customers and sectors that have shown to be weaker as per the stress test results
- Further refine relief measures based on target groups

## SIMULATE IMPACT ON LOSS PROVISIONS

- Input updated macroeconomic forecasts into models
- Update PDs and loss given default (LGD) based on simulation results
- Calculate loss provisions for each loan

## IDENTIFY VULNERABLE SECTORS

- Individually assess any loans where obligors appear highly vulnerable to hemorrhage cash as per the stress test results
- Sector analysis reviewing aggregated impact on RWA and provisions
- Contagion impact and supply chain analysis for large corporates that appear more vulnerable, potentially leveraging analytics
- Review collateral and guarantees in place

# Key Metrics for Banks to focus on

- **Supply chains** (auto, technology, commodities), **Oil and Energy** as well as **Discretionary spending portfolios** could see higher defaults
- Defaults in **Leveraged portfolios** likely to increase
- Pockets of **Commercial real estate** in certain geographies could worsen

- With volatility in markets on the rise, **short term debt** can likely dry up
- FIs depending on overt reliance on the short term funding will face a likely **liquidity crunch** along with **higher borrowing costs**

- **Loan growth** likely to take a hit among uncertainty since budgeted capex expenditures will be put on hold
- **Retail spends driven by discretionary spending** also likely to see a decline

- Deteriorating asset quality could mean **increase in lifetime expected losses (ECL)**
- **NIM under pressure due to rate cuts**
- Both factors could lead to **downward pressure on profitability**

# Key Considerations for Banks

## Key points to consider while developing a stress testing program

### Development of Robust Stress Testing Framework

- What first principles should one employ in putting together a stress testing framework?  
How can one undertake reverse stress testing especially in a cost effective manner using first principles?
- Sample stress test models compliant with Basel II and III to purchase for you?

### Stress Testing as part of overall Enterprise Risk Management

- How important is stress testing in overall ERM framework?
- What linkages do other ERM component such as Risk Appetite, Governance, Credit models have on the stress testing?
- Is it possible that stress testing alone can be used for assessment of risk without other components?

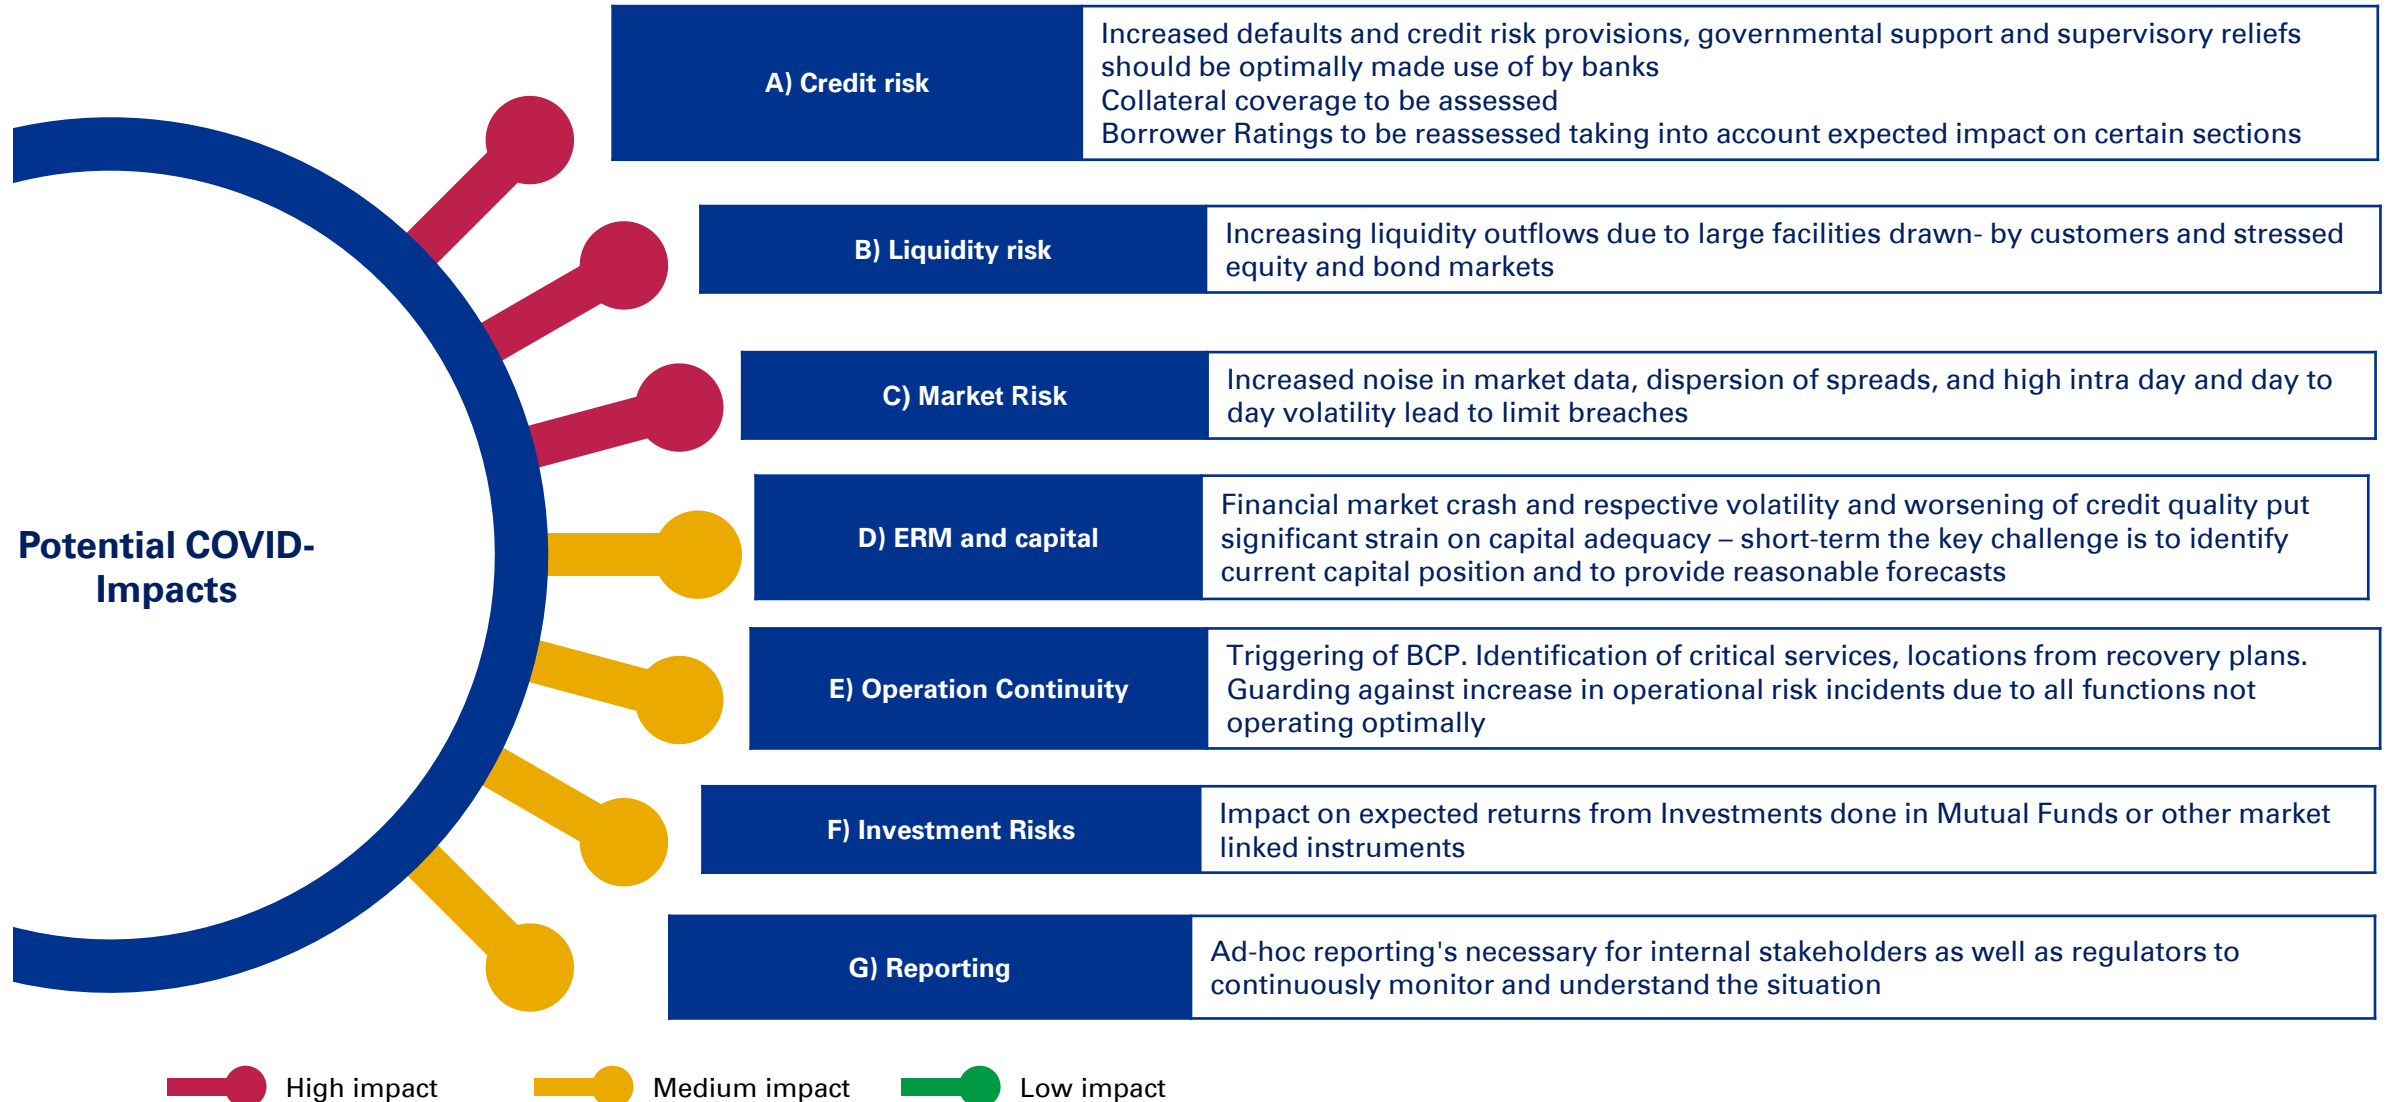

### Identification of stresses sectors

- The key parameters to consider in stress testing under COVID-19 scenarios and sample templates to be used?
- Will all companies survive this pandemic? How prevalent is the possibility of an L shaped post COVID - 19 Curve in certain sectors of the portfolio, which sectors in your view demonstrate such risk?

### Corrective Action based on the results of stress tests

- Stress testing typically results in building buffers to withstand stresses. These buffers typically come with significant costs. How do you position the trade off between stress buffers and profitability?
- If market conditions change, how could liquidity needs and cash availability change?  
What actions could we take in the event of a liquidity crisis, and how long could we sustain operations?  
How is Covid-19 an impact to our society and corporate environment and how can we overcome the challenge?

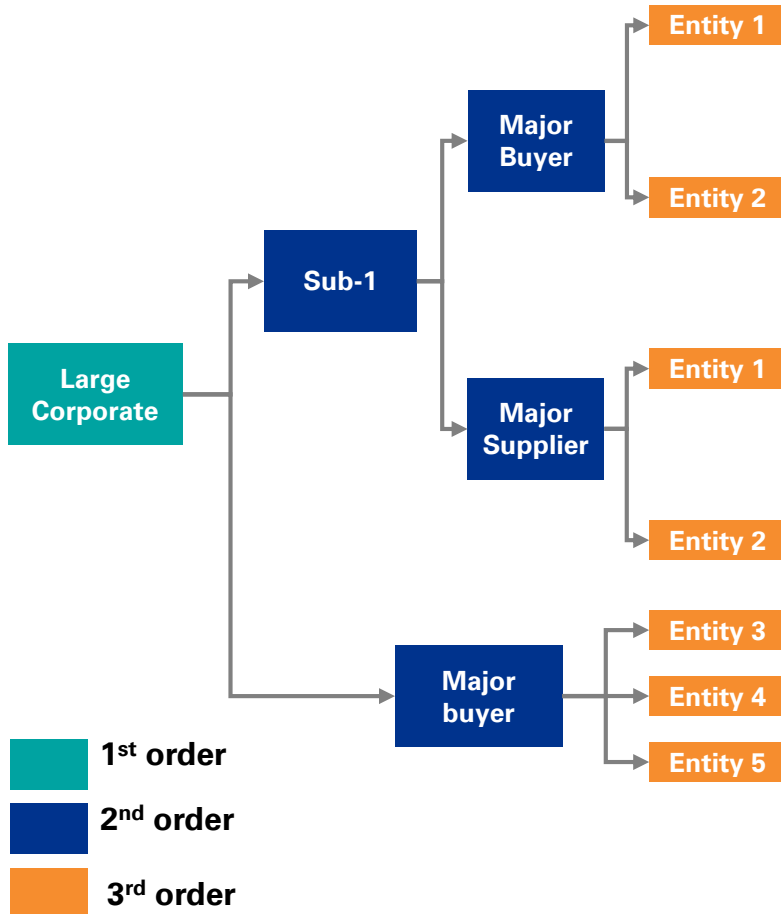

# Areas for Applying Stress Testing

# Modelling for Contagion Effect under COVID-19

*One key objective of the stress tests will be to identify the vulnerable borrowers linked up and reliant on a single supply chain eco-system- particularly the top borrowers or suppliers of a large corporate*

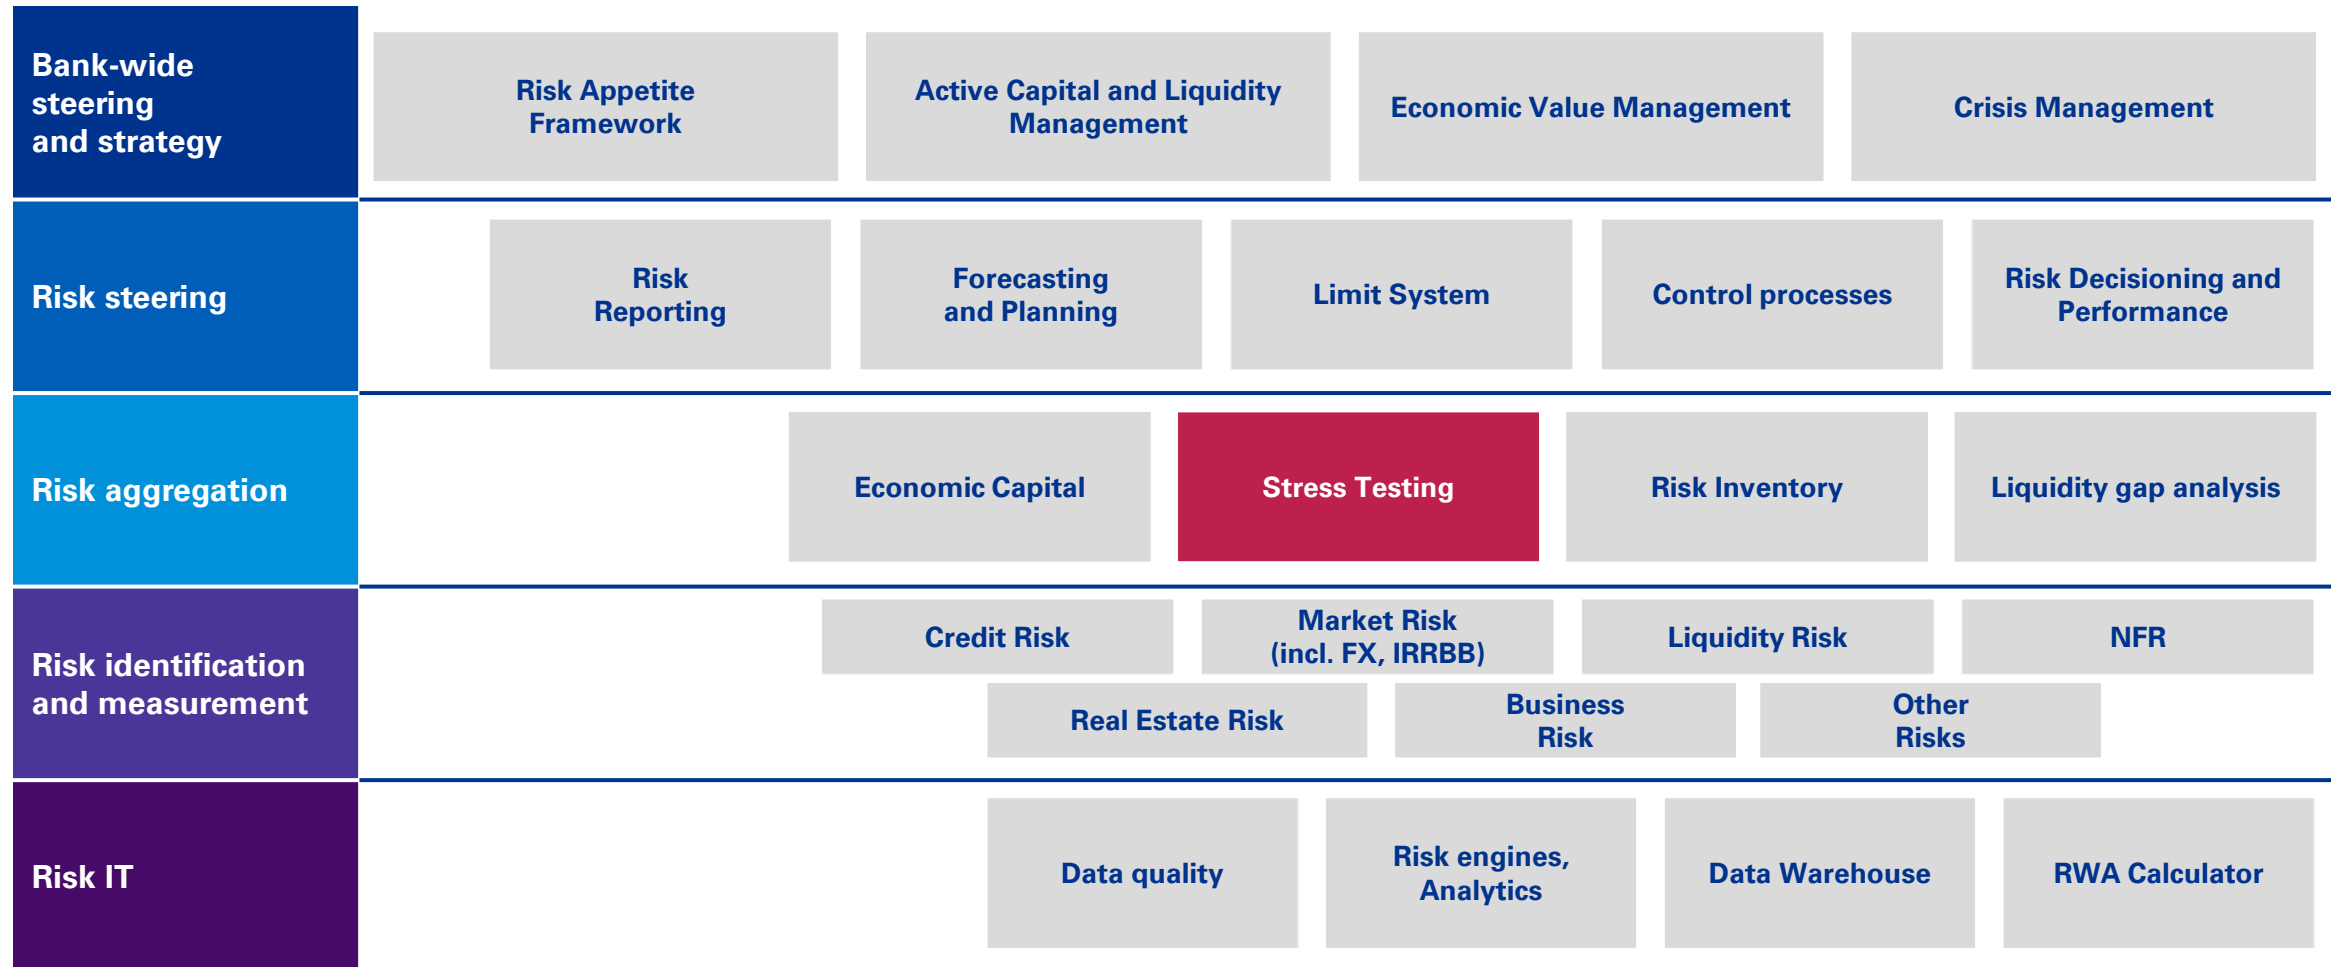

- **1<sup>st</sup> Order:** Large corporate entities that are identified as most vulnerable under the stress scenarios
- **2<sup>nd</sup> Order:** Key subsidiaries dependent on parent for financial support or operating in the same sector, Key buyers or suppliers of the parent entity or key subsidiary
- **3<sup>rd</sup> Order:** Suppliers and buyers to the 2<sup>nd</sup> order entities; typically the MSME sector which have the potential to go bust if 2<sup>nd</sup> order entities slow down or have payment delays

## Our Approach

- Identify the most vulnerable 1<sup>st</sup> order entities through stress tests
- Identify **stressed correlation among entities** or **use alternate copulas with more extreme tail dependence** to account for impact of COVID-19
- Alternatively construct **credit stress propagation networks** and **calibrate contagion parameters** for infectious defaults
- Assess total amount of direct/indirect exposure to the 2<sup>nd</sup> and 3<sup>rd</sup> order impact entities; and estimate the loss based on the contagion effect

# Embedding stress testing in other risk management post COVID scenario

How KPMG can assist you

# How KPMG can assist you

## Key Activities

- Review of bank's current approach of application of stress testing to assess the COVID impact
  - Coverage and adequacy
  - Framework and methodology
  - Scenarios constructed
  - Quantification techniques applied
  - Subjective assessments
  - Assumptions
  - Outcome
- 
- Conduct discussions with the bank to understand and share our viewpoints
- 
- Review the computations conducted by the bank
- 
- Benchmarking with industry leading practices
- 
- Provide areas of enhancements from an independent advisor standpoint
- 
- Present and discuss our views with management

## Timeline

- 1 week
- 
- 1 week
- 
- 2 weeks
- 
- 3 days

During the course of the engagement, at any point of time, if the bank wants our services to help them conduct any of the additional areas of stress test or assist them in implementation of our suggestions on enhancements, we will be happy to provide this support to the bank

# Our Offerings in stress testing

We have tools that could be deployed by banks to carry out stress test and analyze the results for decision making. We also harness our experience derived from multiple implementations across banks to develop scenarios specific to a bank's portfolio, whilst keeping in mind the quality of available data

### Tool

The Tool interface includes sections for Scenario Definition, Assumptions, and a Matrix/Forecast table. Below the interface, the following key features are listed:

- Flexible interface to read the required shock factors as input.
- Adjustable format to input regulatory and hypothetical scenarios.
- Adaptability to portfolio
- specific risk characteristics.

### Output

The Output section displays a line chart for Projected Cash Balance (INR) over four years and a bar chart for Liquidity Ratio under different shock scenarios. Below the charts, a table shows the impact of Shock 1 on the liquidity ratio of stable funds of individuals:

Shock 1	Liquidity Ratio	
	Pre Shock	Post Shock
Moderate	8%	176.63%
Medium	10%	176.56%
Severe	20%	176.42%
Internal	15%	175.79%

Key features include:

- Capability to comprehend impact on cash flows and requirement of immediate liquidity buffer; impact on the entity's balance sheet under stress etc.

### Dashboard

The Dashboard displays a bar chart for Post Shock Impact on CRAR and another for Stress Testing Impact. Below these, the following key features are listed:

- Intelligent dashboard to gauge the impact of stressed conditions.
- Graphical comparison of the impact on liquidity, capital adequacy, solvency and profitability.

### Eligible Capital - Computation

# Our other range of services

Financial Risk Management (FRM) is an integral part of a global practice that offers a broad range of financial risk management services. We help banks, non-bank financial institutions, insurance companies, and corporate bodies to identify, assess, measure, manage and report various financial risks they face.
