Energy Natural Resources and Chemicals (ENRC) **KPMG** International

Over the past decade India's standing in the global clean energy space has transformed. The scale of clean energy deployment has caught the attention of the world. In CoP 21 in Paris, India set out ambitious goals on the energy transition which were further reinforced and scaled at CoP 26 in Glasgow. We expect those ambitions to be exceeded.

However, in the past 5-6 years it has also become apparent that India is very vulnerable on some key dimensions. The growing economy needs ever more energy, and energy needs resources, materials and manufactured products and systems. Beyond energy projects development where India has excelled, the full value chain needs addressing. There is massive concentration of most clean energy manufacturing in China which places India and the rest of the world at great risk. The war in Ukraine has brought to the fore the broader challenges on energy security and the risk to the economy at large. As a very large energy importer India is extremely exposed, and alternatives that make the country less vulnerable are essential.

The risk India and the world faces fortunately affords great opportunity. If India gets the manufacturing and supply chain story right, it would serve not only the nation but also derisk the world. Indeed, it is the expectation of many other nations that India would work to create new manufacturing and supply chains to serve them along with serving domestic needs.

We believe that this is eminently possible. In this paper we identify the key imperatives in this regard. As KPMG in India we also believe that we have a significant role to play in this through our work with governments, industries, innovators and entrepreneurs, the financing community, civil society and other stakeholders. This paper is a significant initiative towards that end where we bring out the various dimensions that need to be worked on to turn this great opportunity into reality.

Five levers for competitive green energy manufacturing

Strategies

Strategy 1

Category sourcing strategy

Strategy 2

Value engineering initiatives

Strategy 3

Manufacturing efficiency through visual and digital enablers

Effective capacity expansion management

Strategy 5

Knowledge management program (KMP) and Result Focused Skill Development (RFSD)

Energy transition could create ~5-6 million jobs by 2030 and ~9-10 million by 2047 in India, of which ~30 per cent could be required in the clean energy manufacturing sector. India needs to develop a strong skilling strategy for areas such as R&D, where there are significant skill gaps.

Job creation expected across the below three dimensions

India for India (I for I)

Of the ~8-9 million jobs needed to meet domestic ambitions, almost ~30 per cent will be in manufacturing and the rest in construction and installation, operations and maintenance, and fuel supply.

<u>(2000)</u>

India for the world (I for W)

By providing ~10% of the required workforce in key regions such as North America, Oceania, MENA etc, India will be able to create ~0.8 million to 1 million jobs by 2050.

Source: KPMG Analysis | India Briefing, 28th June 2023 - India's Global Capability Centers Market Estimated to Reach USD110 Billion by 2030, Accessed 31st August

World from India (W from I)

India houses almost 50 percent of worldwide GCCs. Energy majors such as BP and Shell have opened GCCs in India. The momentum is likely to continue, as India offers large pools of talent and niche skills in areas like engineering, digital technology and data analytics.

New technologies such as Batteries, Green Hydrogen (GH) and Carbon Capture Utilisation and Storage (CCUS) demand deep skills and would need a more aggressive approach to talent development.

© 2023 KPMG Assurance and Consulting Services LLP, an Indian Limited Liability Partnership and a member firm of the KPMG global organisation of independentmember firms affiliated with KPMG International Limited, a private English company limited by guarantee. All rights reserved.

Green Hydrogen and its derivatives - a deep skills area

Green Hydrogen will create a full ecosystem that will have to be synchronized and harmonized

Source: KPMG Analysis

R&D and innovation in end use technologies – fuel cell vehicles, hydrogen DRI, etc would need a strong focus

Supply chain and downstream applications space including green chemicals will require great focus in education, skills and innovation

Reskilling/upskilling of people involved in conventional energy-related roles will need to be taken forward programmatically to ensure the availability of experienced talent, as well as to make the transition inclusive.

• To address its clean energy ambitions, India will need an average annual investment of USD 350-**400 billion by 2047**¹.

> carbon hydrogen, biofuels and e-fuels, and technologies such as batteries, pumped storage and electric mobility aside from energy efficiency measures. It is also supported by the deployment of innovative technologies, such as carbon capture, utilisation and storage (CCUS) and plastic waste recycling.

> Globally, almost USD4.5 trillion will be required annually from now until 2050² to cater to energy transition journey.

ENRich 2023 | Pivoting to Leadership | 14

India's energy transition will be triggered by its climate commitments and potential for energy security and self-sufficiency

India is not impervious to the climate crisis, which has been manifesting as extreme weather events across the country. Moreover, an evergrowing demand for energy from its expanding population and infrastructure development initiatives is creating a need for it to fast-track energy transition.

The country stated its climate ambitions through the enhanced Nationally Determined Contribution (NDC) in 2022 and Panchamrit Declaration during COP 26 in 2021. These commitments aim to make India a leader in energy transition by focussing on aggressive energy efficiency targets, a shift to clean fuels and self-sufficiency through backward integration.

SUCCESSIU energy transition will require suppy **Chains** tobe reimagined

The acceleration of the global and Indian energy transition will depend on investment in developing supply chains to meet capacity deployment needs until 2030 and beyond.

Effective energy transition depends on the development of diversified supply chains, which are highly centralised at present.

• Manufacturing for the domestic and global clean energy and ancillary industries (like transmission) presents a USD300-400 billion market opportunity for India by 2030 cumulatively

> The global energy transition represents a massive opportunity for the clean energy technology manufacturing market, but significant regional and technology disparities need to be addressed to take advantage of it.

However, at present, manufacturing capacity and

pipelines are disproportionate across regions and technologies. While some segments like solar are expected to witness an oversupply (which may help in exports, if cost competitive), others like wind only have the capability to meet deployment needs until 2030.

Global renewable energy supply chains are concentrated in China

Over the last 15 years, China's emergence as a global manufacturing hub has created an oligopolistic environment. The centralisation of supply chains and the resulting lack of price control due to overreliance on a single country is a key risk for global renewable energy capacity deployment, further intensified by disruptions and price shocks

caused by Covid-19 and increasing geopolitical risks.

The surge in polysilicon prices in mid-2021 clearly exposes these risks. During the year, dominant supplier China witnessed operational disruptions and closure of large plants due to the pandemic and accidents, significantly impacting prices.

The conflict in Europe has further exposed the potential fragility of global supply chains and the threat of unforeseen events to energy transition as a whole.

The emergence of China as a global manufacturing hub, coupled with the growing importance of the

energy transition, has strongly linked supply chains with geopolitics. As a result, there is a global attempt to diversify and secure renewable energy supply chains by adopting approaches such as the 'China + 1' strategy.

Global polysilicon price trend (USD/kg) Jan-20 Mar-20 May-20 Jan-21 May-21 Nov-21 Jan-22 Nay-22 May-22 May-22 May-22

India has already surpassed its NDC of 40 per cent installed electricity capacity from non-fossil fuel sources, made under the Paris Agreement.⁵ It now has the potential to develop its domestic capacity further to support its ambitious target of 500 GW non-fossil fuel installed capacity by 2030. This potential will drive the creation of a large market for clean energy equipment manufacturers in the country.

Additionally, India is seeking to supplement China as an export hub. This opportunity will initially be

Clean technology manufacturing in India presents a USD300-400 billion opportunity by the end of this decade

High captive demand, increased supplier base, government support, regulatory enablers and unique domestic capabilities make India a strong contender in this space. In addition to key clean energy equipment, India can also target manufacturing of balance of system components

and transmission equipment.

Considering its domestic demand and potential for exports, the country can take advantage of a significant sales opportunity, in terms of manufactured product value, up to 2030.

restricted to sectors with established manufacturing capabilities, such as solar and wind energy, but may develop to cover newer technologies such as electrolyser and battery manufacturing.

In order to support the significant capacity deployment, the country's transmission capabilities will need to be augmented with an estimated 50,890 circuit kilometre (ckm) of transmission lines and 4,33,575 MVA of substation capacity by 2030.6

This will create additional manufacturing opportunities across the nation.

Domestic and global opportunities across segments that India can target in its path to leadership in clean technology manufacturing

Established and mature technology Domestic opportunity

- Over 220 GW of additional capacity likely by 2030
- Scaling up of existing domestic manufacturing capabilities and strong future pipeline
- Strong government support for manufacturing

Global manufacturing adequacy upto 2030

The country has the ingredients needed to be a clean technology manufacturing hub; The industry must strengthen its manufacturing and sourcing strategy and focus on value engineering, effective expansion management and other levers.

The global manufacturing landscape can be divided into cost-effective destinations that offer competitive pricing and developed hubs that stand out for their higher production costs but stringent regulations.

With a 28.4 per cent share in global manufacturing output⁷, China is firmly placed at the top of costeffective destinations due to government policies and suitable demography. On the other hand, Europe is known for its innovations, superior products albeit with high labour costs and strict regulations. The global economy is seeking a reliable source that can provide high-quality products at a competitive price.

India's supplier ecosystem including core commodities, sizable young and skilled workforce,

emerging culture of innovation, and government initiatives make it a favourable destination for a wide range of manufacturing activities including in clean energy space. However, at present, clean technologies manufacturing is highly dependent on countries such as China and Australia for raw materials and Europe for technologies.

For example, in the manufacturing of solar modules, India imports 80-85 per cent of components like solar cells, glass, aluminium frames and encapsulants from China⁸. Furthermore, most of the machines used by Indian manufacturers are developed by Chinese original equipment manufacturers (OEMs).

	India's requirements	Country/r depends o

Five levers for Indian companies in clean technology manufacturing

Indian manufacturers need to rapidly evolve a strategy to enhance their capabilities. **KPMG in India believes that**

2

Strategy 1

Category sourcing strategy

Indian companies must identify reliable sources to ensure consistent supply of components for clean energy manufacturing and establish procurement processes that align with industry best practices.

Several companies in the country have proactively established strategic partnerships with leading Chinese firms. These collaborations have enabled these companies to meticulously map each component of their supply chain.

The base needs widening to include significant non-Chinese players and eventually a more domestic ecosystem of research and innovation. Some players have been actively engaging in an indigenisation drive by forming joint ventures with Indian manufacturers to source components locally.

Similarly, sourcing issues also need to be addressed in allied sectors such as transmission equipment. Fluctuations in the price of raw materials, copper, CRGO steel, transformer oil and aluminium needed to manufacture transformers are a key concern for industry players. In addition to this, large unutilized capacity, aggressive pricing by competitors, monopoly of labs and higher rates for short-circuit testing are some of the key issues to be addressed.

© 2023 KPMG Assurance and Consulting Services LLP, an Indian Limited Liability Partnership and a member firm of the KPMG global organisation of independentmember firms affiliated with KPMG International Limited, a private English company limited by guarantee. All rights reserved.

five competitive levers would be critical in this regard.

Strategy 4

Effective capacity expansion management

Strategy 5

Knowledge management program (KMP) and Result **Focused Skill** Development (RFSD)

A few best practices of major energy players¹⁰

Common procurement practices

Assessment of category risk based on experience

Single line quotes that make it hard to track raw material price movement

High-risk contracts without adequate clauses

compare

To prioritise innovation and drive progress, **manufacturers** should focus on approaches such as value analysis or value engineering (VA/VE).

This strategic methodology enables the revaluation of existing designs and manufacturing processes to generate alternative solutions that lower product costs. Some companies in India have successfully used it to demonstrate significant benefits and cost reductions to the tune of 5-7 per

Category Glass Aluminium

Ribbon and

Encapsular

¹⁰ KPMG Analysis ¹¹ KPMG Analysis

Spot buying from multiple suppliers

Absence of specification for input materials, making quotes hard to

Best practices

Contracts with price indexation with 2-3 suppliers to procure at best cost and mitigate supply risks

Structured and documented short- and long-term risk strategy for all categories

Detailed cost breakdown for insights into raw material requirement to take advantage of index-linked pricing

Robust contracts with clauses that cover service quality and performance to mitigate every potential risk

Clear specifications and aligned supplier quotes

Strategy 2

Value engineering initiatives

cent.

Similarly, companies should opt for design optimisation, which requires teams like engineering, quality, procurement, sales and others to come together. Other ideas for optimisation that **businesses can leverage are competition** benchmarking, zero based budgeting, supplier interactions, customer interactions and internal VA/VE exercises.

Cost reduction across solar value chain through strategic implementation (illustrative)¹¹

	Value engineering initiative
	 Thickness optimisation Material content re-examination Configuration change
frame	 Profile change to reduce weight/metre Coating thickness optimisation
bus bar	Profile changeDesign change
t	 Alternative chemistry for encapsulant GSM optimisation

Manufacturing efficiency through visual and digital enablers

Green energy equipment manufacturers in the country must prioritise the optimisation of their existing facilities by balancing capacity management and enhancing Overall Equipment Effectiveness (OEE).

Strategy 3

OEE can be boosted by using visual and digital enablers that help identify the cause of repeated

failures. Through the application of core digital technologies overlaid with extensive analytics using artificial intelligence (AI), machine learning, IoT and others, visual and digital enablers make suggestions to help mitigate performance loss.

Similarly, rework and rejections are hidden capacity losses. A case in point is rejections generated by Taber & Stringer machines during the process of solar module manufacturing, which are detected at the lamination stage. Rework done in the post-lamination stage affects the 'first time right' score and capacity.

Several Indian companies are generating realtime data by using visual and digital enablers. More of them must adopt such innovative approaches to rapidly move up the value chain and develop the country as a global leader in the space.

Capacity extension is aimed at achieving a vertical ramp-up and has two key components – early equipment management (EEM) and original equipment manufacturer (OEM) management.

EEM covers the entire CAPEX lifecycle starting from starting from equipment design, manufacturing, installation, commissioning, operationalization, performance monitoring and spares management to continuous improvement. It also involves the documentation of learnings and problems faced during past installations.

OEM management, on the other hand, focusses on the relationship between a manufacturer and

Strategy 4

Effective capacity expansion management

equipment provider or OEM.

Considering that Indian clean technology manufacturing companies are looking at rapid expansion at an exponential scale, effective capacity expansion through EEM and OEM management are extremely critical aspects for them.

These methodologies can help green manufacturers to register a nearly 50 per cent reduction in ramp-up time. They can also enable the establishment of a robust foundation for production launch and facilitate productivity optimisation during ramp-up to enhance long-term competitiveness.

(in months) to reach 85% capacity

Strategy 5

Knowledge management programme and result-focussed skill development

Other tools that manufacturers can utilise to enhance their businesses include Knowledge Management Programme (KMP) and Result-focussed Skill Development (RFSD).

KMP refers to the effective organisation, capture and sharing of information throughout an establishment. KMP helps leverage learnings from experience and

1	Ilustrative RFS	D framework ¹⁴	
	Forklift maintenance	Types of sensors, uses and troubleshooting	
	Bearing / belts / pulley , operations and upkeep	Chiller operations and troubleshooting	Technical RFSD topics
	Air compressor operations and troubleshooting	Drives and troubleshooting	

Many Indian manufacturers have already embraced elements of the five competitive levers essential for success. However, there is a growing recognition that they need to do more to remain competitive in today's dynamic environment. To thrive in the globalised

successful initiatives/projects to avoid mistakes and drive improvements.

Additionally, given that attrition is a key challenge across the green energy market, manufacturers can adopt RFSD. This approach focusses on existing challenges and skill deficits and aims to develop expertise across the technical and functional domains.

marketplace, they must prioritise efficient sourcing and innovation and invest in process management and skill development, facilitated by technology and comprehensive training programmes.

¹⁴ KPMG Analysis

ncia will need to play to its Strengths and accress its WEAKNESSES

- instruments.

An evaluation of India's manufacturing sector positions it favourably in terms of supplier ecosystem and collaborations and partnerships. While R&D, innovation and financing have emerged as key areas of concern, areas such as government support

Critical enablers: India's competitive positioning on key values¹⁵

¹⁵ KPMG India Industry sentiment survey from Industry leaders

• Domestic and global energy transition could create a demand for 5-6 million jobs by 2030 and 9 -10 million by 2047 in India; India must focus on developing skills in R&D, digitisation and core technologies. New technologies such as batteries, hydrogen and its derivatives, and CCUS demand deep skills and will need a more aggressive approach to talent development.

• Re skilling/upskilling people involved in conventional energy-related roles needs to be taken forward programmatically to ensure the availability of experienced talent which will also facilitate an inclusive transition.

• Skilling for energy transition should follow an industry needs driven approach where government and industry work in close conjunction to identify and address skill gaps as well as collaborate in development of curriculum

• India needs to create an ecosystem that focusses on innovation, for example, by encouraging start-ups and enabling collaborations.

• Financing flows will need to be debottlenecked by targeting risks across technologies and value chains with innovative commercial frameworks and

> and availability of skills demonstrate scope for improvement

> These are the areas on which the country must focus its efforts to achieve its target of becoming a frontrunner in global clean energy.

Supplier ecosystem

Key manufacturing clusters

Indian suppliers operating across sectors and geographies can provide components and assemblies in which they already excel. Their experience can be directly leveraged by green energy manufacturers, resulting in supplier consolidation and capability augmentation.

Given the differing processing needs of solar PV, Li-ion battery and electrolyser production, **the** presence of clusters with diverse capabilities along with the existing auto sector and electronic manufacturing will enhance the country's manufacturing efficiency.

Government support

Regulatory frameworks play a pivotal role in shaping economic growth.

The Indian government has rolled out numerous business-friendly policies, such as **Remission of Duties and Taxes on Exported** Products, PM Gati Shakti, India Industrial Landbank, National Single Window System and PLI schemes to position India as an attractive investment and manufacturing destination.

India is amongst the top 5 manufacturing countries in the world¹⁶ and has a vibrant manufacturing ecosystem with manufacturing clusters¹⁷ pan India spread across multiple sectors. Further, India has strong capabilities in processing which can be leveraged across various RE technologies.

- **Processing capabilities:** India provides essential services like machining, fabrication, processing and various other activities crucial for the clean energy production value chain. Its supplier network is adaptable and can be calibrated to serve the needs of this sunrise sector.
- Geographic advantage: Southern and western India have several clusters across the auto and auto ancillaries, industrial manufacturing and electronics sectors. These regions offer varying processing capabilities and are preferred investment destinations.

Its state governments have added to these schemes, providing an additional impetus to the manufacturing sector.

With regions such as EU providing aggressive support to clean energy manufacturing under EU Green deal provisions, the support on India side may have to scale up substantially to give a competitive edge.

W

Wh

Availability of talent

India boasts a vast working population and a young demographic with high proficiency in science, technology, engineering and mathematics (STEM).

However, the pace of transition in the energy sector

As per KPMG in India, energy transition could create a demand for 5-6 million jobs by 2030 and 9-10 million by 2047 across the three dimensions.

India for India (I for I)

Of the ~8-9 million jobs needed to meet domestic ambitions, almost ~30 per cent will be in manufacturing and the rest in construction and installation, operations and maintenance, and fuel supply.

India for the world (I for W)

By providing ~10% of the required workforce in key regions such as North America, Oceania, MENA etc, India will be able to create ~0.8 million to 1 million jobs by 2050.

Source: KPMG Analysis | India Briefing, 28th June 2023 - India's Global Capability Centers Market Estimated to Reach USD110 Billion by 2030, Accessed 31st August 2023 Note: Job numbers include Direct & Indirect jobs; Technologies: Solar, Wind, Biofuels, Hydropower, GH, Battery, PSP & Grid

© 2023 KPMG Assurance and Consulting Services LLP, an Indian Limited Liability Partnership and a member firm of the KPMG global organisation of independentmember firms affiliated with KPMG International Limited, a private English company limited by guarantee. All rights reserved.

is as never before and with it accelerating skill development becomes a top priority as demand for jobs across sub sectors and job families is set to far outstrip the supply. The demand for skills increases if we factor in domestic as well as global requirements.

World from India (W from I)

India houses almost 50 percent of worldwide GCCs. **Energy majors such as BP** and Shell have opened GCCs in India. The momentum is likely to continue, as India offers large pools of talent and niche skills in areas like engineering, digital technology and data analytics.

India needs to overcome capability gaps through skilling, upskilling and reskilling

An analysis of talent across India's technology value chains shows gaps upstream because its workforce has been predominantly engaged in project development and operations.

As India is now focussing heavily on manufacturing, it will need to prioritise skill development in areas such

Given the significant emphasis on these technologies both in India and worldwide, it will be crucial for the country to take the steps needed to establish

as R&D, SCM, manufacturing and others. Further, while there is an availability of talent for mature technologies such as solar and wind, especially for downstream activities, new technologies like green hydrogen and CCUS will need a more aggressive approach to talent development.

a well-defined plan and roadmap for relevant skill development.

India will need to play to its strengths and address its weaknesses

Green Hydrogen will create a full ecosystem that will have to be synchronized and harmonized

Source: KPMG Analysis

While planning talent development and supply, India should have a clear strategy that considers both conventional and clean energy, as a pool of workforce from the conventional energy sector, especially from the coal value chain is likely to be available for re-deployment in sunrise sectors by 2030.

As per IEA energy outlook report 2021, 85% reduction in coal-fired power generation and 60% reduction in domestic coal mining is expected by 2040 in India leading to a job loss of ~0.5 million.The segment may continue to face a degrowth in jobs, as the government looks at phasing down coal.

Therefore, it is must for India to focus on reskilling/ upskilling people involved in conventional energy-related roles to ensure the availability of experienced talent that will facilitate an inclusive transition.

R&D and innovation in end use technologies fuel cell vehicles, G2 DRI, etc

Supply chain and downstream applications space including green chemicals will require great focus in education, skills and innovation

India needs to define a new approach to skilling to support the energy transition

The traditional education system is not aligned with the skill requirements of an era of energy transition. The skill gap is more pronounced in rural areas, the informal sector, and among women and underrepresented groups. It is imperative that a new approach to skilling is defined to support the green energy revolution. The new approach will encompass

- of curriculum

ENRich 2023 | Pivoting to Leadership | 28

Collaborations and partnerships

India must focus on collaborations in existing and upcoming energy transition-related areas to accelerate technology innovation, supply chain development, commercialisation and deployment.

Moreover, industry leaders, in partnership with specialised domestic and international small or mid-

size organisations and the government, must lead the way with active research and development, testing and demonstration, technology scale-up, large-scale deployment and commercialisation to ensure the development of the manufacturing sector for energy transition technologies.

Public-private partnerships, in which governments contribute risk capital and incentives, can attract substantial investment for the development of manufacturing capabilities. The Government of India has taken a step in this direction with the introduction of incentives under the SIGHT programme, launched under the National Green Hydrogen Mission to support electrolyser and green hydrogen production.¹⁹

Other types of collaborations that offer long-term advantages are industry-academia partnerships and research and development collaborations. These partnerships provide tested technology for deployment as well as incentivise R&D organisations and academic institutions.

Businesses can tap supply chain advantages by forming strategic **collaborations with raw** material and/or component suppliers. They can sign long-term supplier agreements that provide benefits such as indirect vertical integration.

Industry players and technology providers can partner to innovate in emerging technologies. Such partnerships shape the future by offering a firstmover advantage and also enable companies to be prepared for change. **Collaboration with** specialised domestic or international technology providers across the energy transition supply chain can deliver multiple benefits like knowledge sharing, risk reduction, better economics and an opportunity to leverage expertise and pool resources.

A well-thought-out collaboration strategy can offer numerous benefits and help India to emerge as a hub that supports the shift towards clean energy.

R&D and innovation

The clean energy manufacturing value chain in India is struggling with issues like low efficiency, scarcity of critical minerals and legacy ecosystems. This creates a need for innovation as a core element. As India seeks to advance on its climate ambitions

Innovations that improve Innovations that enhance existing products Innovations that enhance existing processes to add value

For example, product improvements like increasing cell efficiency or process improvements like diamond wire sawing to reduce wastage during wafer cutting.

Start-ups can play a key role in the development of an innovation ecosystem

Economies that are open to disruption are more likely to thrive as the energy transition speeds up. In India. start-ups are increasingly becoming key stakeholders in the energy transition story by providing ideas, technologies and approaches to sectors traditionally dominated by large conglomerates.

Today's start-ups, having emerged from diverse backgrounds, bring a **unique viewpoint that shows** a deep understanding of sectoral environments. Companies are proving that start-ups can disrupt even established renewable energy segments. In India, Industry as well as academia are increasingly playing a very important role in fostering as well

while grappling with the trilemma of affordability, access and security, it must design a **comprehensive** strategy focussed on encouraging all forms of innovation, whether they aim to 'improve', 'redefine' or 'disrupt'.

Comprehensive support throughout the innovation value chain

Innovations that redefine

Innovations aimed at redesigning an existing product to overcome challenges.

For example, replacement of critical materials in renewable energy equipment with inexpensive and widely available materials

Innovations that disrupt the status quo and change the course of the industry.

For example, wireless charging of EVs, Pervoskite solar cells, energy as a service, etc.

as mentoring innovative entrepreneurs, providing them seed funding support, expert guidance, opportunity to scale up their innovations and commercialize through partnerships. **KPMG in** India's annual ENRich Conference, organised by the Energy and Natural Resources (ENR) business unit, is one such platform that for startups to showcase their energy and **climate innovations**. However, the efforts need to be scaled up with academia, public and private partnership and be programmatically driven with government support.

India will need to play to its strengths and address its weaknesses

With risk comes opportunity. As long as there is scale and the risks can be reasonably addressed through appropriate structures, India can turn these challenges to opportunities at

Development of dedicated capital pool for energy transition needs

Reliance on banks may not be adequate and dedicated channels are likely to be a more successful approach to ensuring sustained funding for manufacturing. Often the capital deployment in terms of clean technology has been focused on wind and solar power plants, however greater emphasis on the equipment manufacturing would be required to drive required shifts so that the value chain is equipped to provide for the required means to grow sustainability. Consequently, the domestic pool can have specific demarcation for identified areas which need greater investment focus.

Addressing cost of capital to encourage shifts

Organisations face significant demand for capital during transition, more so when experimenting with new technologies and approaches. New technologies need to be made affordable and implementable. Schemes and policies that promote demand and encourage production and consumption (for example demand mandates for green hydrogen) will ease capital flows. While PLI schemes have worked well so far, more work is needed in this area. Apart from sector-specific incentives, the transition also calls for an evaluation of the cost of capital. At present, there is no distinction between commercial and sustainable means of gathering capital, and there is an urgent need to focus on providing lower-cost capital in view of climate-related pressures.

Deployment of flexible financing structures

Guarantee structures, offtake commitments and policies to extend loan terms through interest waiver or term relaxation can help develop a more robust and targeted means of viability assessment. Risk-based interventions can be designed to extend mechanisms that support manufacturing in segments that face elevated risks.

Development of supportive policy and regulatory mechanisms

Sectoral policies need to be reviewed to iron out bottlenecks. For instance, promoting hydrogen as an energy source will require support to spur demand and develop scale.Norms must specify the use of low carbon content materials; production standards across manufacturing will need to reflect today's climate urgencies.

Enhancement of capabilities across financial infrastructure

India's financial infrastructure will need to be further developed. That will require policy development, including the notification of sustainable finance taxonomy. Coverage of segments such as cell, modules, batteries, electrolysers would not only emphasize their significance, but pave way for dedicated focus on spurring investments in these critical thematic areas. A structured definition of sustainable finance (taxonomy) and coverage of the segments will not only help banks develop a standard norm for classification but also help formulate rules to mitigate greenwashing.

A parametric scaling of investment requirements across core segments (clean technology manufacturing, hydrogen, CCUS and others) and critical assessment of value chain impediments to scaling capacity, will help develop targeted policies and regulatory interventions. Further, it is essential to invest in developing the capabilities needed to evaluate new asset classes and craft financial products that meet evolving requirements and beyond.²⁰ Credit and risk mechanisms used by financing agencies will need to be rewired to ensure that climate-related factors become a part and parcel of capital flow considerations.

²⁰ India Needs to Spend USD1.4 Trillion More on Clean Energy Shift, Bloomberg, 9th February 2021, Accessed 25th August

ENRich 2023 | Pivoting to Leadership | 31

In Conclusion

We are at a time in history where the actions in the next few years will determine whether the course on global warming can be reversed. This will be a consequence of many interlinked actions. As this paper has attempted to establish, at the core of the transition to clean energy systems would be the manufacturing facilities and supply chains. To scale up and also reduce the massive concentration risks India will have a key role to play. The task is enormous, but fortunately a good start has been made through proactive policies of Government of India and also several states. Turning these policies to outcomes will require a large number of implementation actions in a series of action theatres. Through this paper we have dimensioned the needs but also called out the challenges and imperatives. We believe that all stakeholders, coming together can make this change happen in a manner that is economically rewarding, environmentally responsive and helps society at large in many ways. We remain open to ideas to further this journey and work closely and collaboratively with all stakeholders to make this a reality.
